

WINFRED BRASSICA

A CROSS BETWEEN KALE AND TURNIP

Winfred is a rapeseed: a cross between a turnip and kale. It is the most versatile of the brassicas, being suitable for a wide range of soil fertility and environmental conditions, stock classes and seeding times.

Winfred retains leaf and stem quality in frosty or cold conditions. Once established, it is tolerant of dry conditions. Thus this product becomes a flexible multifaceted tool ideal for summer, fall and winter feeding.

Winfred is early maturing at 10-12 weeks, making it available for prompt grazing and has the ability to be grazed up to three times throughout the season.

Winfred is supported by an aggressive root system thus making it an excellent cover crop option in soil improvement systems incorporated into grazing.

At A Glance

Uses

Dry Hay: Poor

Haylage/Balage: Excellent

Management Intensive Grazing: Good

Continuous Grazing: Fair during fall and spring.

Establishment

Planting Dates: Sept-October or late Feb-mid March

Seeding Rate: 1-3lbs/A in a mix

Depth: surface to 1/2"

Speed: Establishes quickly
